

Information on the exam.

I have now talked to Mats and he told me that his question will be on some aspects of the models that you have discussed on the lectures. He will not require that you should be able to develop or change any aspects of the models on the exam. Nevertheless, knowledge of the properties of the models will be needed.

As I said on the lecture, my first question will be relatively broad on one of the five main subjects that we have covered during the course. I will, however, choose the subject. My second question will consist of three shorter, and more specific questions on some of the papers included in my part of the course.

Good luck,

Mårten
